Research on academic literacy within higher education has focused almost exclusively on the development of academic literacy in English. This book is unique in showing how students use other languages when they engage with written academic content - whether in reading, discussing or writing - and how increasingly multilingual higher education campuses open up the possibility for students to exploit their multilingual repertoires in and around reading/writing for academic purposes. Chapters range from cases of informal student use of different written languages, to pedagogical, institutional and disciplinary strategies leveraging multilingual resources to develop biliteracy. They are ordered according to two dominant themes. The first includes accounts of diverse multilingual contexts where biliteracy practices emerge in response to the demands of academic reading and writing. The second theme focuses on more deliberate attempts to teach biliteracy or to teach in a way that supports biliteracy. The collection will be of interest to researchers, higher education practitioners and students of multilingual higher education and academic literacy. Linear Analysis of Skeletal Structures meets the demands of a typical prominent structural engineering educator who aims to: "teach students how to model, how to use computer packages in real contexts, to validate models, verify results and

carry out parameter studies. Hand analysis is now only for very simple problems and for back-of-envelope checks". The checks referred to are usually statically based and it is therefore presumed that the reader has a firm background in statics. This unique book principally: - tackles statically indeterminate structures - replaces traditional hand analysis teaching of indeterminate structures by a workbook format approach based on qualitative and quantitative (computer analysis) studies - provides comprehensive coverage of the behavior of skeletal structures - beams, plane trusses arches, plane frames, space trusses, grids and space frames - uses case studies to provide experience of, using computer packages in real contexts; worksheets to develop qualitative understanding; and computer based problems to carry out parameter studies - emphasises computer modeling and the validation of computer models and solutions. A workbook approach is used with individual chapters covering fundamentals, beams, plane trusses, arches, plane frames, space trusses, grids, and space frames. Each chapter describes the fundamental behavior of a particular structural form, which is supplemented by qualitative examples and problems. The book will make essential reading for all levels of structural, civil, mechanical and aerospace engineers. The book will be an invaluable aid for all students of structural and civil engineering, from the later years of an undergraduate course through to postgraduate work and the early stages of graduate training within the field.
