In fall 2015, the newly elected Trudeau government endorsed the Paris Agreement and promised to tackle global warming. In 2016, it released a major report which set out a national energy strategy embracing clean growth, technological innovation and carbon pricing. Rather than putting in place tough measures to achieve the Paris targets, however, the government reframed global warming as a market opportunity for Canada's clean technology sector. The Big Stall traces the origins of the government's climate change plan back to the energy sector itself — in particular Big Oil. It shows how, in the last fifteen years, Big Oil has infiltrated provincial and federal governments, academia, media and the non-profit sector to sway government and public opinion on the realities of climate change and what needs to be done about it. Working both behind the scenes and in high-profile networks, Canada's energy companies moved the debate away from discussion of the measures required to create a zero-carbon world and towards market-based solutions that will cut carbon dioxide emissions — but not enough to prevent severe climate impacts. This is how Big Oil and think tanks unraveled the Kyoto Protocol, and how Rachel Notley came to deliver the Business Council of Canada's energy plan. Donald Gutstein explains how and why the door has been left wide open for oil companies to determine their own futures in Canada, and to go on drilling new wells, building new oil sands plants and constructing new pipelines. This book offers the background information readers need to challenge politicians claiming they are taking meaningful action on global warming. Are you wishing to master the driving stick? Are you trying to be fully in charge of your manual car as you've heard it's way more satisfying than an automatic one? But you've also heard it's not easy. There are gearshifts to master, your engine can stall, your car can roll backward on a hill, and understanding the clutch is a nightmare. So, what if I told you using a clutch is no more difficult than using a faucet, or that your car's handbrake is a lot more than just a 'parking brake', or that I can teach you - in one sentence - how to avoid ever stalling your engine? I've already taught thousands of people how to drive stick - men and women of all ages - normal people, not engineering students or race car engineers. And I can teach you. This book is definitely what you're looking for. One of the toughest lessons every business leader learns is how hard it is to generate sustained growth. Stalled growth is the rule, not the exception—even for the best-managed companies. That's especially true in unpredictable economic environments such as the one we're experiencing today. McKee has a unique understanding of what happens when growth stalls. His firm commissioned a study of 700 companies that had at one time been among the nation's fastest-growing businesses. Developed in concert with Decision Analyst, a leading national research and consulting firm, the study probed areas as diverse as corporate structure, competition, branding, finance, and strategy. The target respondent profile were CEOs, owners, principals, presidents, managing directors or chairmen of the board. In-depth follow-up interviews yielded fascinating stories and personal comments from executives who had been living on the front lines of real-life growth crises. McKee presents compelling knowledge about how and why companies lose their way, and offers practical advice about how they can rekindle growth. When Growth Stalls demonstrates that sluggish growth is generally produced not by mismanagement or strategic blundering but by natural market forces and management dynamics that are often unrecognized—and widespread. The book presents seven characteristics that commonly correlate with stalled growth and what to do about them. Some are external forces to which countless companies have fallen victim: economic upheavals, changing industry dynamics, and increased competition. What McKee points out, however, is how often they catch companies off-guard. More surprising are four subtle and highly destructive internal factors that conspire to keep companies down: lack of consensus among the management team, loss of nerve, loss of focus, and marketing inconsistency. McKee makes the case that, regardless of what's going on outside of an enterprise, it's what's inside that counts. Are you wishing to master the driving stick? Theoretical studies have predicted that operation of a helicopter rotor beyond certain combinations of thrust, forward speed, and rotational speed might be prevented by rapidly increasing stalling of the retreating blade. The same studies also indicate that the efficiency of the rotor will increase until these limits are reached or closely approached, so that it is desirable to design helicopter rotors for operation close to the limits imposed by blade stalling. Inasmuch as the theoretical predictions of blade stalling involve numerous approximations and assumptions of blade stalling, an experimental investigation was needed to determine whether, in actual practice, the stall did occur and spread as predicted and to establish the amount of stalling that could be present without severe vibration or control difficulties being introduced. A Tea-Stall by the Side of the Road is a collection of short stories based on anecdotes, folklore and urban legends from all over the country. Presented in the first person narrative, these stories are based on actual experiences. A tea-stall, popularly called a 'tapri' in India, is a place where people gather to gossip, share news and views, tales and anecdotes. It is also the favoured place for inspiration and the author's preferred spot for writing his book. The book is well-suited to be read over a relaxing cup of tea, around the coffee table or around a campfire on a weekend getaway trip. It has stories from all genres including humour, drama, horror and romance. Thus, there is something good for every mood and taste. IT'S TIME TO STOP STALLING AND START SELLING.

The VR-7 airfoil was experimentally studied with and without a leading-edge slat at fixed angles of attack from 0 deg to 30 deg at $Re = 200,000$ and for unsteady pitching motions described by $a = a_m + 10 \text{ deg} \sin(\omega t)$. The models were two dimensional, and the test was performed in a water tunnel at Ames Research Center. The unsteady conditions ranged over $Re = 100,000 - 250,000$, $k = 0.001 - 0.2$, and $a_m = 10 \text{ deg} - 20 \text{ deg}$. Unsteady lift, drag, and pitching- moment measurements were obtained along with fluorescent-dye flow visualizations. The addition of the slat was found to delay the static-drag and static-moment stall by about 5 deg and to eliminate completely the development of a dynamic-stall vortex during unsteady motions that reached angles as high as 25 deg. In all of the unsteady cases studied, the slat caused a significant reduction in the force and moment hysteresis amplitudes. The reduced frequency was found to have the greatest effect on the results, whereas the Reynolds number had little effect on the behavior of either the basic or the slatted airfoil. The slat caused a slight drag penalty at low angles of attack, but generally increased the lift/drag ratio when averaged over the full cycle of oscillation. In the calculation of the weights of the wings, a simple type of spar structure was assumed that permitted an integration across the span to determine the web and the flange weights. The covering and the remaining weight were taken in proportion to the wing area. The total weights showed the wings with camber and washout to have the lowest weights and indicated the minimum for wings with a taper ratio between 1/2 and 1/3. Today’s wind energy industry is at a crossroads. Global economic instability has threatened or eliminated many financial incentives that have been important to the development of specific markets. Now more than ever, this essential element of the world energy mosaic will require innovative research and strategic collaborations to bolster the industry as it moves forward. This text details topics fundamental to the efficient operation of modern commercial farms and highlights advanced research that will enable next-generation wind energy technologies. The book is organized into three sections, Inflow and Wake Influences on Turbine Performance, Turbine Structural Response, and Power Conversion, Control and Integration. In addition to fundamental concepts, the reader will be exposed to comprehensive treatments of topics like wake dynamics, analysis of complex turbine blades, and power electronics in small-scale wind turbine systems. This book constitutes the refereed proceedings of the 17th International Symposium on VLSI Design and Test, VDAT 2013, held in Jaipur, India, in July 2013. The 44 papers presented were carefully reviewed and selected from 162 submissions. The papers discuss the frontiers of design and test of VLSI components, circuits and systems. They are organized in topical sections on VLSI design, testing and verification, embedded systems, emerging technology.
